1. Introduction

1.1. Project background

Western Sydney Parklands Trust (WSPT) lodged a referral to the then Department of Environment (DotE) for a super lot subdivision and early site stage establishment works for the Eastern Creek Business Hub along Beggs Road, Eastern Creek NSW. The proposed action sought to consolidate the existing landholdings, subdivide the site into three developable lots and one residue lot for environmental management, plus complete site establishment works including roads and stormwater drainage. The site is about 35 ha in size.

The action was determined to be a controlled action due to significant impacts on *Cumberland Plain Woodland* (CPW) and *Shale Gravel Transition Forest* (SGTF). The proposed development was approved on 18 May 2015 with conditions.

1.2. Commencement of works

1.3. Variations

Works in Stage 1 commenced in 2018 and Stage 2 commencement in March 2021. Stage 3 has commenced but not been completed.

To facilitate the Stage 3 works, the approval holder sought a variation to EPBC 2012/6617 under s143 of the EPBC Act. The variation was to remove an area of 0.73 ha from the 'vegetation to be retained'. The variation was approved on 26 April 2024. To compensate for the removal of the 0.73 ha of CPW from protection under the Vegetation Management Plan (VMP), the approval holder retired 5 ecosystem credits under the NSW Biodiversity Offset Scheme on 16 May 2024 (Transaction CT-3378), as shown in Appendix A.

The impact area associated with Stage 3 was proposed to change. The NSW government has approved Stage 3. The Commonwealth is currently assessing the matter as EPBC 2020/8715.

1.4. Vegetation Management Plan

A VMP dated 4 September 2018 was approved by the Commonwealth Department of Energy and Environment on 25 September 2018.

An updated VMP (version 8 dated October 2022) was approved by the Commonwealth Department of Climate Change, Energy, the Environment and Water on 9 November 2022.

To ensure consistency with the s143 Variation granted on 26 April 2024, version 9 of the VMP was submitted and approved by the Department on 21 June 2024 (Appendix B). This version removed the need to manage the 0.73 ha of vegetation. See Figure 1 below for the updated extent of VMP.

1.5. Reason for this report

This is the fourth annual report, prepared in compliance with condition 7 of the EPBC Approval which states:

Within three months of every 12-month anniversary of the commencement of the action, the approval holder must publish a report on their website addressing compliance with each of the conditions of this approval, including implementation of any management plans as specified in the conditions. Documentary evidence providing proof of the date of publication and non-compliance with any conditions of this approval must be provided the Department at the same time as the compliance report is published. The approval holder must also notify any non-compliances with this approval to the Department within 5 business days of becoming aware of the non-compliance.

Figure 1: Proposed VMP Area boundary as depicted in Version 9 of the VMP (ELA 2024)

2. Compliance reporting

The following table provides a summary of the approved condition and their respective compliance status, outcomes achieved and whether further action is required.

Table 1: Compliance with CoA as granted under the s143 variation (26 April 2024)

Number	Condition	Compliance Y/N	Date due	Status	Details
1	The approval holder must clear no more than 2.1 hectares of Cumberland Plain Shale Woodlands and Shale-Gravel Transition Forest ecological community (CPW) on the project site, as defined and identified as “CPW to be removed” at Annexure 1	Y	Ongoing	Ongoing	All clearing of EPBC Act CPW contained within approved development footprint and has not exceeded 2.1 ha
2	<p>To protect the remaining CPW on the project site, the approval holder must prepare and submit a management plan for the Minister’s approval. The approval holder must not commence the action unless the Minister has approved the management plan. The approved management plan must be implemented prior to the commencement of the action. The plan must include actions to:</p> <ul style="list-style-type: none"> • Protect the remaining CPW from indirect impacts as a result of the proposed action • Rehabilitate and restore remaining CPW on site; and • Produce conservation outcomes to the benefit of 	Y	Prior to commencement of the action	Complete	<p>Original VMP was approved by the Minister on 25 September 2018.</p> <p>Current VMP (Version 9, 11 June 2024) was approved by the Minister on 21 June 2024 (Appendix B).</p> <p>The 5 additional biodiversity credits have been retired on 16 May 2024 (Transaction number CT-3378, Appendix A)</p>

Number	Condition	Compliance Y/N	Date due	Status	Details
	<p>CPW on the project site and the adjoining bushland</p> <ul style="list-style-type: none"> To compensate for the removal of 0.73 hectares of CPW from protection under the vegetation management plan, the approval holder must retire 5 ecosystem credits under the NSW Biodiversity Offset Scheme by 1 January 2025. The approval holder may satisfy the requirement in condition 2d to retire 5 credits through payment into the Biodiversity Conservation Fund, the amount determined in accordance with the offset calculator established under the Biodiversity Conservation Act 2016. <p>Note: the management plan may be included within a broader WSPT plan of management</p>				
3	<p>To address the loss of 2.1 hectares of CPW on the project site, the approval holder must retire 49 ecosystem credits under the Biobanking agreement for the advanced offset site at Chandos West, before the commencement of the action. 	Minister has approved the revised management plan, then the approval holder must continue to implement the management plan originally approved, as specified in the conditions.				
11	If at any time after 5 years from the date of this approval, the approval holder has not commenced the action, then the approval holder must not commence the action without the written agreement of the Minister.	Y	Within 5 years of the date of the approval	Complete	The action commenced in 2018.
12	Unless otherwise agreed to in writing by the Minister, the approval holder must publish all management plans referred to in these conditions of approval on their website. Each management plan must be published on the website within 1 month of being approved.	Y	Ongoing	Ongoing	Reports up to VMP Version 9 are published at the following link Western Sydney Parklands Parklands business hubs

3. Conclusion

ELA, on behalf of WSPT has prepared this Compliance Report to fulfil condition 7, and in doing so, all conditions of the project Approval (EPBC 2012/6617).

Appendix B – Minister approval (21 June 2024)

Joshua French
Chief Executive
Level 1, 6 and 8 Parramatta Square
10 Darcy Street
Parramatta NSW 2150
Joshua.french@gsp.nsw.gov.au

Approval of Revised Action Management Plan Eastern Creek Business Hub, NSW:

Eastern Creek Business Hub Vegetation Management Plan, Version 9, 17 June 2024

Dear Mr French

Thank you for the revision of the above plan that was submitted by the Western Sydney Parklands Trust on 17 June 2024 for approval in accordance with Conditions 2 and 9 attached to the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) approval 2012/6617 dated 18 May 2015. The original request and draft was submitted on your behalf by Angela Wang of Frasers Property Australia on 30 April 2024.

Officers of the department have advised me the revised plan meets the requirements of the conditions of the approval for this project. On this basis, and as a delegate of the Minister for the Environment and Water (the Minister), I have decided to approve the revised plan. This plan must now be implemented. It is noted that the plan is largely the same as 2018 version. It refers to future commitments and milestones as they were in 2018 rather than the situation as at 2024. Any future versions of the plan should provide updated information, including on the progress of actions to restore and rehabilitate critically endangered Cumberland Plain Shale Woodlands and Shale-Gravel Transition Forest.

As you are aware, the department has an active monitoring program which includes monitoring inspections, desk top document reviews and audits. Please ensure that you maintain accurate records of all activities associated with, or relevant to, the conditions of approval so that they can be made available to the department on request.

Should you require any further information please contact Anthony Richards at PostApproval@dcceew.gov.au.

Yours sincerely

Sara Broomhall
Director
Post Approvals (WA, NSW, ACT, Vic and Tas) Section

1. Introduction

1.1 Project Background

Narla Environmental Pty Ltd (Narla) has been engaged by the Western Sydney Parklands Trust (WSPT) to conduct vegetation monitoring and mapping of weed densities and for the protection, restoration and rehabilitation of Cumberland Plain Woodlands and Shale-Gravel Transition Forest ecological communities. These vegetation communities are associated with the development of the Eastern Creek Quarter Shopping Centre, Eastern Creek. All works on the ground and monitoring parameters are in accordance to “Vegetation Management Plan” Prepared by Ecological Australia (ELA 2018).

The VMP details the works to be undertaken to meet requirements set out within the Biosecurity Act 2015 and in accordance with environmental best practices. VMP works will be aimed at restoring the ‘Endangered Ecological Community’ Shale Plains Woodland (SPW), a component of Cumberland Plain Woodland (CPW), which is listed as Critically Endangered under the NSW Biodiversity Conservation Act 2016 (BC Act 2016). The VMP Works will also aim to restore the Alluvial Woodland (AW), a part of River-Flat Eucalyptus Forest (RFEF) which is also listed as an ‘Endangered Ecological Community’ under the BC Act 2016.

A subsequent modification of the VMP under EPBC 2012/6617, approved on the 24th April 2024, removed the need to manage the 0.73ha of Management Zone 1a (ELA 2024; **Appendix A**). Therefore, Survey plot 3 (SP3) has been excluded from the Year 4 monitoring assessment onwards.

The general aim of the VMP is to detail the rehabilitation of areas adjacent to the development including roads and services, weed removal, revegetation, on-going maintenance, and monitoring requirements. To track progress towards achieving this goal surveys were conducted in March 2025 within the bushland areas of the VMP to establish baseline data for ongoing monitoring (ELA 2018).

This report aims to track the changes to the health and diversity of flora and fauna existing within the site over time and to address the performance criteria identified by the initial VMP through vegetation surveys and photo monitoring.

1.2 Site Description

The site is located within Blacktown City Council (BCC) Local Government Area in Eastern Creek. The VMP area is approximately 17.6 ha in size (**Appendix A**). The site is bordered by Westlink (M7) to the east, Great Western Highway (A44) to the south, Eastern Creek Quarter Shopping Centre to the west, and bushland and a reserve to the north. The VMP area is a mostly flat and includes areas of remnant bushland and grasslands.

The VMP has divided works into three (3) management zones (**Appendix A**). These zones have been created to better manage and maintain restoration treatments and objectives.

- Zone 1: Regeneration; comprised of remnant bushland to be regenerated to RFEF and CPW ecological communities
- Zone 2: Revegetation; comprised of areas mostly dominated by pasture grass with few native shrubs or trees present, includes potential batters and a gas line easement.
- Zone 3: Revegetation – Wetlands; comprised of areas to be revegetated to native wetland, includes the construction of the channel base within constructed creek swales and an onsite stormwater detention basin to comply with **Blacktown City Council stormwater design**. Stage 3 of the development has not yet

been completed **and as such, the wetlands are not functionally operational**. This zone of the VMP is still under the Developers control.

Ecological Australia (ELA) has undertaken the VMP monitoring works in Year 1 and Year 2. These works included photo point monitoring and quadrat data collection. Muru Mittigar has undertaken the on-ground VMP works, including site preparation, primary weed control works.

Due to the COVID-19 lock downs and restrictions throughout Year 1 causing severe and extensive delays to the implementation of the VMP from July to November 2021. The delays were communicated to the Department via email on 5 August 2021. DAWE responded in agreeance to halting works due to COVID-19 and stated that works could be resumed when possible.

Toolijooa Pty Ltd via a tender process were appointed as the new bush regeneration contractors in October 2023 and began Year 3 onsite works in November 2024. Narla Environmental took over as the Project Ecologist in February 2024, undertaking the VMP monitoring and reporting works for Years 3 and 4.

This report captures all the work undertaken in Year 4, covering the period from January – December 2024.

2. Methodology

2.1 Annual Monitoring Assessment

A monitoring assessment was undertaken by Narla Ecologists, Philip Maxwell and Gemma Hicks, on 10th of March 2025; and by Narla Ecologist, Philip Maxwell, on the 19th of March 2025.

A total of eight (8) monitoring plots across three (3) management zones were established in February 2021 (**Figure 1**). The monitoring plots were sampled for full floristic diversity and cover, in line with the 'plot based floristic vegetation survey' in the Biodiversity Assessment Method (BAM) (DPIE 2020). To achieve a more general overview of the vegetation condition within each zone and ensure they were sampled appropriately, ELA established permanent monitoring plots 20m x 20m (200m²). The start of each plot was marked with a star picket and cap with the coordinates and bearing recorded. Data collected within each plot included:

- The growth form for each native species;
- Scientific name of each native and exotic species; and
- Estimate of the foliage cover of each native and exotic species within the boundaries of the plot including all attached plant material, alive or dead, rooted in or overhanging the plot. Cover was recorded:
 - qualitatively if less than 1% (e.g. <1);
 - in whole numbers up to 5% (e.g. 1, 2, 3); and
 - to the nearest 5% if >5% cover (e.g. 5, 10, 15, 20, 25).
- Count (when ≤10) or estimate (when >10) the number of individuals of each native and exotic species rooted within the plot. Record abundance as:
 - counts of 1, 2, 3...
 - estimates of 10, 20, 30...
 - 100, 200, 300...
 - 1000, 2000, 3000...
- Photo points were taken at the 0m mark (star picket) (**Figure 1, Appendix B**).

Figure 1. Vegetation Monitoring Plots and Photo Point Directions

2.2 Monitoring Requirements

Section 7 of the VMP (ELA 2018) specifies that baseline monitoring will be undertaken prior to works being commenced to establish a benchmark for performance. This is to include the establishment of photo points and vegetation survey quadrats. Progress reports will then be prepared on an annual basis throughout the establishment period (Years 1 – 3) and biennially until the VMP is fully implemented (Years 4 – 10).

2.2.1 Biometric Benchmarks

Native Vegetation Integrity Benchmarks (or Biometric benchmarks) have been developed by OEH for the composition, structure and function of vegetation communities, based upon the best-on-offer condition for the same vegetation type in the contemporary landscape.

WSPT are committed to achieving Biometric Benchmark 2 conditions, i.e. achievement of between 50% - 100% of the benchmarks for all of their precincts within their Biodiversity Strategy. Further commitments to achieving biometric benchmarks for this site are identified in **Table 1**.

Biometric benchmarks for the two ecological communities identified onsite are identified in **Table 2**.

2.3 Study Limitations

This study was not intended to provide a complete inventory of all flora and fauna species with potential to occur within each zone. The species list provided for each monitoring plot was restricted to what was observed during the site assessment by the Narla Ecologist. The timing of the survey may not have coincided with emergence times of some species of flora, such as seasonally flowering herbs.

A subsequent modification of the VMP under EPBC 2012/6617, approved on the 24th April 2024, removed the need to manage the 0.73ha of Management Zone 1a (ELA 2024; **Appendix A**). Therefore, Survey plot 3 (SP3) has been excluded from the Year 4 monitoring assessment onwards.

Table 1. Key Performance Indicators (KPIs) for Maintenance Phase (Years 4-10).

KPIs for All Monitoring Plots During Maintenance Phase (Years 4-10)
Commencement or completion of all tasks outlined in the VMP.
Management of priority weeds as per statutory regulations. No <i>Rubus fruticosus</i> spp. agg. Patches over 4m ² .
Revegetation is to be undertaken with a minimum of 60% of the benchmark levels for species diversity provided in Appendix C of the VMP (ELA 2018).
At one year post planting, a minimum of 80% survival rate of all vegetation strata planted in each zone (e.g. tree, shrub and groundcover).
Any localised plant failure within planting areas are addressed with no area larger than 2m x 2m without surviving plants at one year post planting.
Maintenance replanting is to replace plants with the same growth form (i.e. tree for tree etc.) and must not decrease species diversity. Any new species to be planted must be from the community being emulated and of local provenance or of provenance for climate change adaptation if required.
A demonstrated increase in native cover and diversity and a demonstrated decrease in exotic cover and diversity by the end of the maintenance period.
Monitoring and reporting undertaken in accordance with Section 7 of the VMP (ELA 2018).
KPIs for All Monitoring Plots at the completion of Year 4
Woody weeds and exotic vines to be less than 2% cover, not allowed to set seed and no establishment of new species.
Exotic ground covers 55% of original extent
Native vegetation cover and species diversity no less than 65% of biometric benchmark in Table 2 .

Table 2. Biometric Benchmarks for Each Identified Plant Community Type (PCT) (ELA 2018).

Plant Community Type (PCT)	Vegetation Community	Vegetation Species Richness			Vegetation Cover (%)		
		Canopy	Shrub	Groundcover	Canopy	Shrub	Groundcover
849	Shale Plains Woodland	5	8	34	52%	18%	77%
835	River Flat Eucalypt Forest	4	8	20	21%	21%	78%

3. Results

3.1 Species Richness and Cover

Narla's year 4 vegetation monitoring showed the condition of Eastern Creek Business Hub was highly variable, with bushland results ranging from poor-quality (low native species richness and high weed cover) to high quality (high native species richness and very low weed cover). Mean species richness and cover collected from the monitoring event undertaken in March 2025 is displayed and is compared against the data collected during the previous monitoring events in **Table 3** and **Table 4**.

Within **Table 3**, **Table 4** and **Table 5**, cells are shaded to represent compliance with the KPI's of the VMP. Green to represent the KPI has been met, orange to indicate the KPI is being progressed towards, and red indicating work is required to meet the KPI. Numbers in red indicate an increase in mean exotic species richness or cover or a decrease in mean native species richness and cover. Numbers in green indicate an increase in mean native species richness or cover or a decrease in mean exotic species richness and cover.

Table 3. Maximum extent of exotic ground layer allowed each year.

Management Zone	Monitoring Survey Plot	Baseline (ELA 2021)	Year 1 (ELA 2021)	Year 2 (ELA 2022)	Year 3 (Narla 2024)	Year 4	Year 6	Year 8	Year 10
Zone 1: Maximum exotic ground layer requirement		N/A	15.6	14.5	13.4	12.3	11.2	10	8.9
Zone 1: Actual exotic ground layer abundance	SP1	22.3	42.3	32	27.5	26.1	-	-	--
	SP3**								
	SP5								
	SP6								
Zone 2: Maximum exotic ground layer requirement		N/A	49	45.5	42	38.5	35	31.5	28
Zone 2: Actual exotic ground layer abundance	SP4	70	71.5	97	95.5	66.8	-	-	-
	SP8								
Zone 3: Maximum exotic ground layer requirement		N/A	31.5	29.3	27	24.8	22.5	20.3	18
Zone 3: Actual exotic ground layer abundance	SP2	45	62.5*	82*	87*	87.1*	-	-	-
	SP7								
Overall maximum exotic ground layer requirement		N/A	36.8	34.2	31.6	28.9	26.3	23.7	21
Overall actual exotic ground layer abundance	-	52.6	61.9	60.5	60.6	55.2	-	-	-

*Only minor staged works have been completed within Zone 3 as Stage 3 of the development has not yet been completed. Stormwater basins are currently not functionally operational. This zone of the VMP is still under the Developers control and will be progressed to compliance requirements on completion of Stage 3 of the development.

** Located within Zone 1a. A subsequent modification of the VMP under EPBC 2012/6617, approved on the 24th April 2024, removed the need to manage the 0.73ha of Management Zone 1a (ELA 2024; Appendix A). Therefore, Survey plot 3 (SP3) has been excluded from the Year 4 monitoring assessment onwards.

Table 4. Performance against PCT Native Groundcover % Benchmark.

Plant Community Type (PCT)	Management Zone	Monitoring Plot Location	Baseline	Year 1 (ELA)	Year 2 (ELA)	Year 3	Year 4	Year 6	Year 8	Year 10
PCT – 849 minimum required			N/A	30.8	38.5	46.2	50	53.9	57.8	61.6
PCT - 849 groundcover abundance	Zone 1	SP1	9.7	13.9	34	43.8	54.4	-	-	-
	Zone 1a	SP3**								
	Zone 1	SP6								
	Zone 2	SP4								
	Zone 2	SP8								
PCT – 835 minimum required			N/A	31.2	39	46.8	50.7	54.6	58.5	62.4
PCT - 835 groundcover abundance	Zone 1	SP5	10.9	12.5	21	30*	33.7*	-	-	-
	Zone 3	SP2								
	Zone 3	SP7								

*See discussion in Section 4.1.1.

** A subsequent modification of the VMP under EPBC 2012/6617, approved on the 24th April 2024, removed the need to manage the 0.73ha of Management Zone 1a (ELA 2024; Appendix A). Therefore, Survey plot 3 (SP3) has been excluded from the Year 4 monitoring assessment onwards.

4. Discussion

4.1.1 Annual Change in Mean Native Species Abundance

Of the two (2) PCT's monitored within the Eastern Creek Business Hub, both showed an increase in mean native species abundance. PCT 835 includes the cover percentage of SP2 and SP7 which falls within Management Zone 3. As previously mentioned, bush regeneration works have not been conducted within Management Zone 3 as this stage of the development is yet to be completed and handed over to WSPT. Therefore, the data presented for this community in **Table 4** is not reflective the effectiveness of the bush regeneration works for PCT 835, as the native cover for the areas of the PCT 835 being actively managed (SP5) is 86%.

The overall increase in mean native species richness could be attributed to many factors. The recent weather conditions may be providing favourable conditions for the emergence and flowering of native herbs and grasses (which were observed within more plots) and may have been less conspicuous during the previous survey period. Increased mean species richness may also be the result of both active (planting) and passive (natural regeneration) species recruitment following bush regeneration works which was observed throughout several of the subject reserves. Native groundcover abundance within PCT 849 areas does meet the benchmark requirements. Although native groundcover abundance within PCT 835 areas do not meet the benchmark requirements, there are positive trends to be observed which show positive signs for the plant communities. Once bush regeneration works are allowed to be conducted within Zone 3, it is likely that the native groundcover benchmarks will be met.

The overall changes in mean native species cover could be attributed to discrepancies between observers as a result of observer bias or the overestimation of baseline data. Such fluctuations are to be expected in the initial years within monitoring and are expected to plateau with continued monitoring if weather conditions remain consistent. Furthermore, the BAM method of identifying species cover is not an 'exact science' and some variability (up to 10%) is to be expected.

4.1.2 Annual Change in Mean Exotic Species Abundance

Of the three (3) Vegetation Management Zones monitored within the Eastern Creek Business Hub, all three (3) zones showed a decrease in mean exotic species abundance.

The reduction in mean exotic species abundance in some zones may be attributed to bush regeneration works that have occurred within the subject reserves as well as potential discrepancies between observers as a result of observer bias or the overestimation of baseline data. Although decreases in abundance across the zones have been observed, the exotic abundance requirements have not been met; therefore, further bush regeneration works are required to continue reduction of exotic ground covers to meet the requirements. There is an overall declining trend across all zones which is optimistic for the future of the area.

It is expected that information collated from the analysis of long-term monitoring data (i.e., over a 10-year timeframe) will divulge more meaningful information regarding the progress of regeneration works. As such, the continuation of annual monitoring will be vital in ensuring key performance indicators are on track and met.

Table 5. Performance criteria – Year 4.

Performance Criteria	Results following the Year 4 (2025) Survey.
KPIs for All Monitoring Plots During Maintenance Phase	
Commencement or completion of all tasks outlined in the VMP.	On Track; With the exception of works within Management Zone 3. All tasks have been commenced.
Management of priority weeds as per statutory regulations. No <i>Rubus fruticosus spp. agg.</i> Patches over 4m ² .	Criteria met; stabilisation of <i>Rubus fruticosus sp. agg</i> population in Management Zone 1. Minor (<1%) coverage of <i>Rubus fruticosus sp. agg</i> present within Management Zone 2, specifically SP8; bush regeneration works occurring throughout to manage all priority weeds.
Revegetation is to be undertaken with a minimum of 60% of the benchmark levels for species diversity provided in Appendix C of the VMP (ELA 2018).	Criteria met; revegetation only using species provided in Appendix C of the VMP (ELA 2018) evident.
At one year post planting, a minimum of 80% survival rate of all vegetation strata planted in each zone (e.g. tree, shrub and groundcover).	Criteria met; No planting death of infill planting was observed during the Year 4 (2025) monitoring event. Should infill planting death be observed in between monitoring events, replacement of dead individuals should be undertaken immediately.
Any localised plant failure within planting areas are addressed with no area larger than 2m x 2m without surviving plants at one year post planting.	Partial; whilst no infill planting death was observed, encroachment of exotic species in proximity (within 5m) to infill plantings was observed. Weed management and exotic suppression should be focused on areas in proximity to infill plantings and priority weeds.
Maintenance replanting is to replace plants with the same growth form (i.e. tree for tree etc.) and must not decrease species diversity. Any new species to be planted must be from the community being emulated and of local provenance or of provenance for climate change adaptation if required.	Criteria met; No infill planting death was observed during the Year 4 (2025) monitoring event. Should infill planting death be observed in between monitoring events, replacement of dead individuals should be undertaken immediately.
A demonstrated increase in native cover and diversity and a demonstrated decrease in exotic cover and diversity by the end of the maintenance period.	Criteria met; Increases in native and decreases in exotic coverage have been observed across all management zones. However, exotic coverage requirements of the VMP have not been met as of the Year 4 (2025) monitoring event; therefore, further bush regeneration works are required.
Monitoring and reporting undertaken in accordance with Section 7 of the VMP (ELA 2018).	Criteria met; This report has been prepared for Year 4 of the monitoring.
KPIs for All Monitoring Plots at the completion of Year 4	
Woody weeds and exotic vines to be less than 2% cover, not allowed to set seed and no establishment of new species	Criteria met; 2.9% woody weeds and exotic vines. No new species of woody weeds or exotic vines established within Management Zones 1, 2 or 3.

Exotic groundcover covers 55% of original extent (28.9%).	Criteria not met; baseline monitoring (ELA 2021) recorded exotic groundcover at 52.6% coverage; therefore, to meet the KPI exotic groundcover coverage of <28.9% was required. As of the Year 4 (2025) monitoring event, overall exotic groundcover coverage is 55.2%. This is partially due to the restriction of bush regeneration works within Management Zone 3. Exotic groundcover coverage has been reduced by 5.4%, from 60.6%, within the year (Narla 2024).			
<p>Native vegetation cover to be no less than 65% of biometric benchmark in Table 2.</p> <p>Green cells indicate KPI has been met. Red cells indicated KPI has not been met.</p>	Criteria not met.			
	PCT (Vegetation Layer)	Biometric Benchmark (%)	65% of Biometric Benchmark (%)	Vegetation Cover (%)
	PCT 849 (Canopy)	52	33.8	24.3
	PCT 849 (Shrub)	18	11.7	4.55
	PCT 849 (Groundcover)	77	50.1	51.4
	PCT 835 (Canopy)	21	13.7	11.6
	PCT 835 (Shrub)	21	13.7	0.3
	PCT 835 (Groundcover)	78	50.7	25.3

5. Management actions and Focus for Year 5 & 6

Bush regeneration works should continue throughout Management Zones 1 and 2 to ensure annual and long term KPIs are met and to maintain the suppression of weed cover. Focus on priority weeds, specifically *Rubus fruticosus* spp. agg. (Blackberry) within Management Zone 2, *Eragrostis curvula* (African Lovegrass) within Management Zones 1, 2 and 3; and *Senecio madagascariensis* (Fireweed) within Management Zones 1 and 2. Reduction of high coverage exotic species, including *Verbena bonariensis* (Purpletop vervain), *Setaria parviflora*, *Sida rhombifolia*, (Paddy's Lucerne), *Paspalum* spp. (Caterpillar Grasses) and *Chloris gayana* (Rhodes Grass) should be targeted to assist natural native regeneration across all Management Zones, where possible.

Zone 3 to remain in holding until Stage 3 of the development is completed and the stormwater flow is sufficient to meet the design to provide functional operation of the wetland. Zone 3 to be monitored for any threats to other zones and actioned accordingly.
